Mid-term Presentation

Motif-aware method for graph analysis

Hoang Nguyen (M2), Supervisor: Assoc. Prof. Tsuyoshi Murata

2017/02/03

Scales of network analysis:

- Macroscopic (global view)
- Microscopic (interactions)
- Mesoscopic (sub-structures)

Network motifs are ¹

patterns of statistically significant interconnections occurring in complex networks.

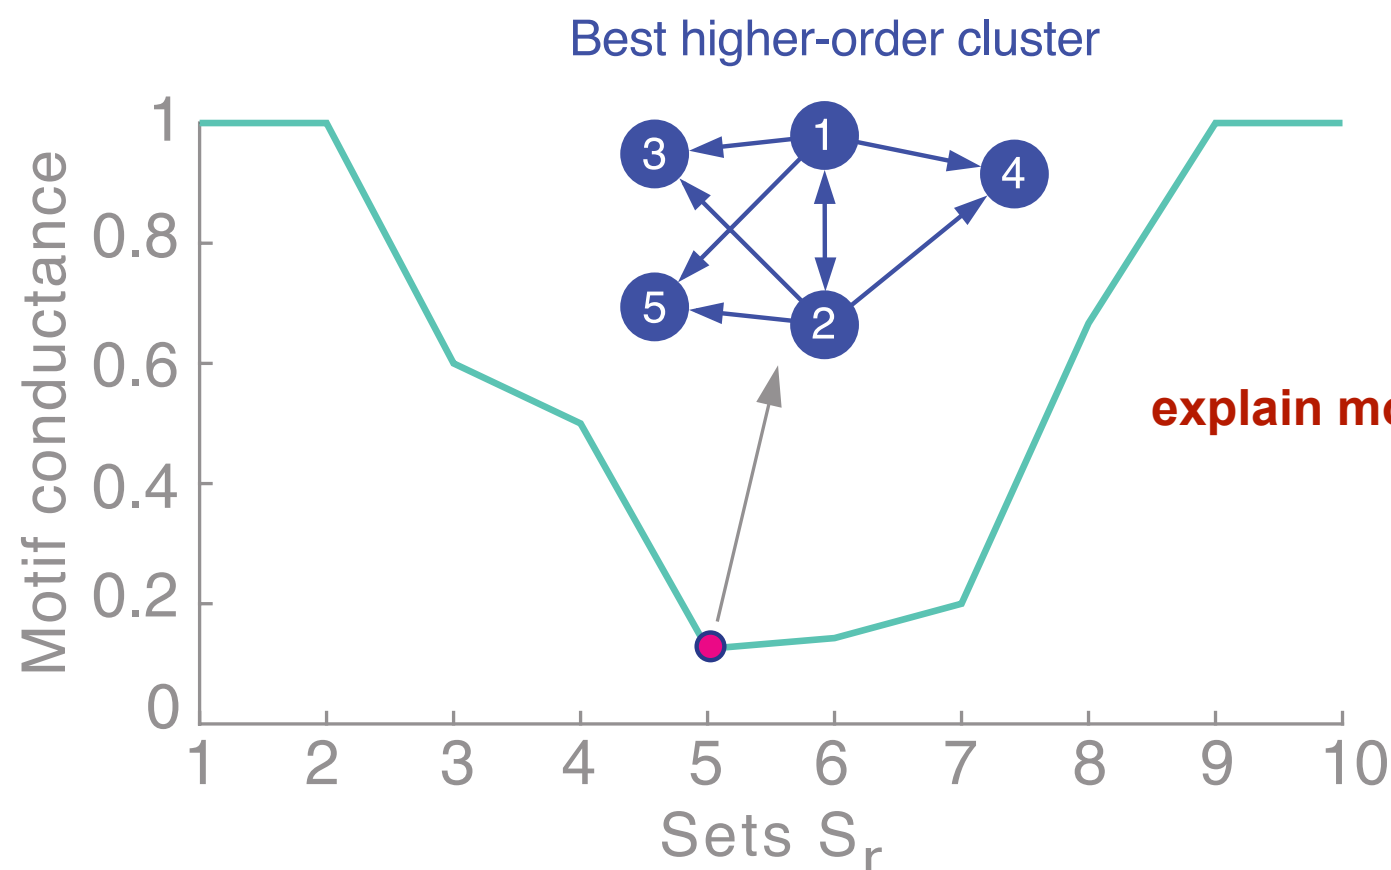

Applications

- Social networks ²
- Biological systems ^{1,3,4}

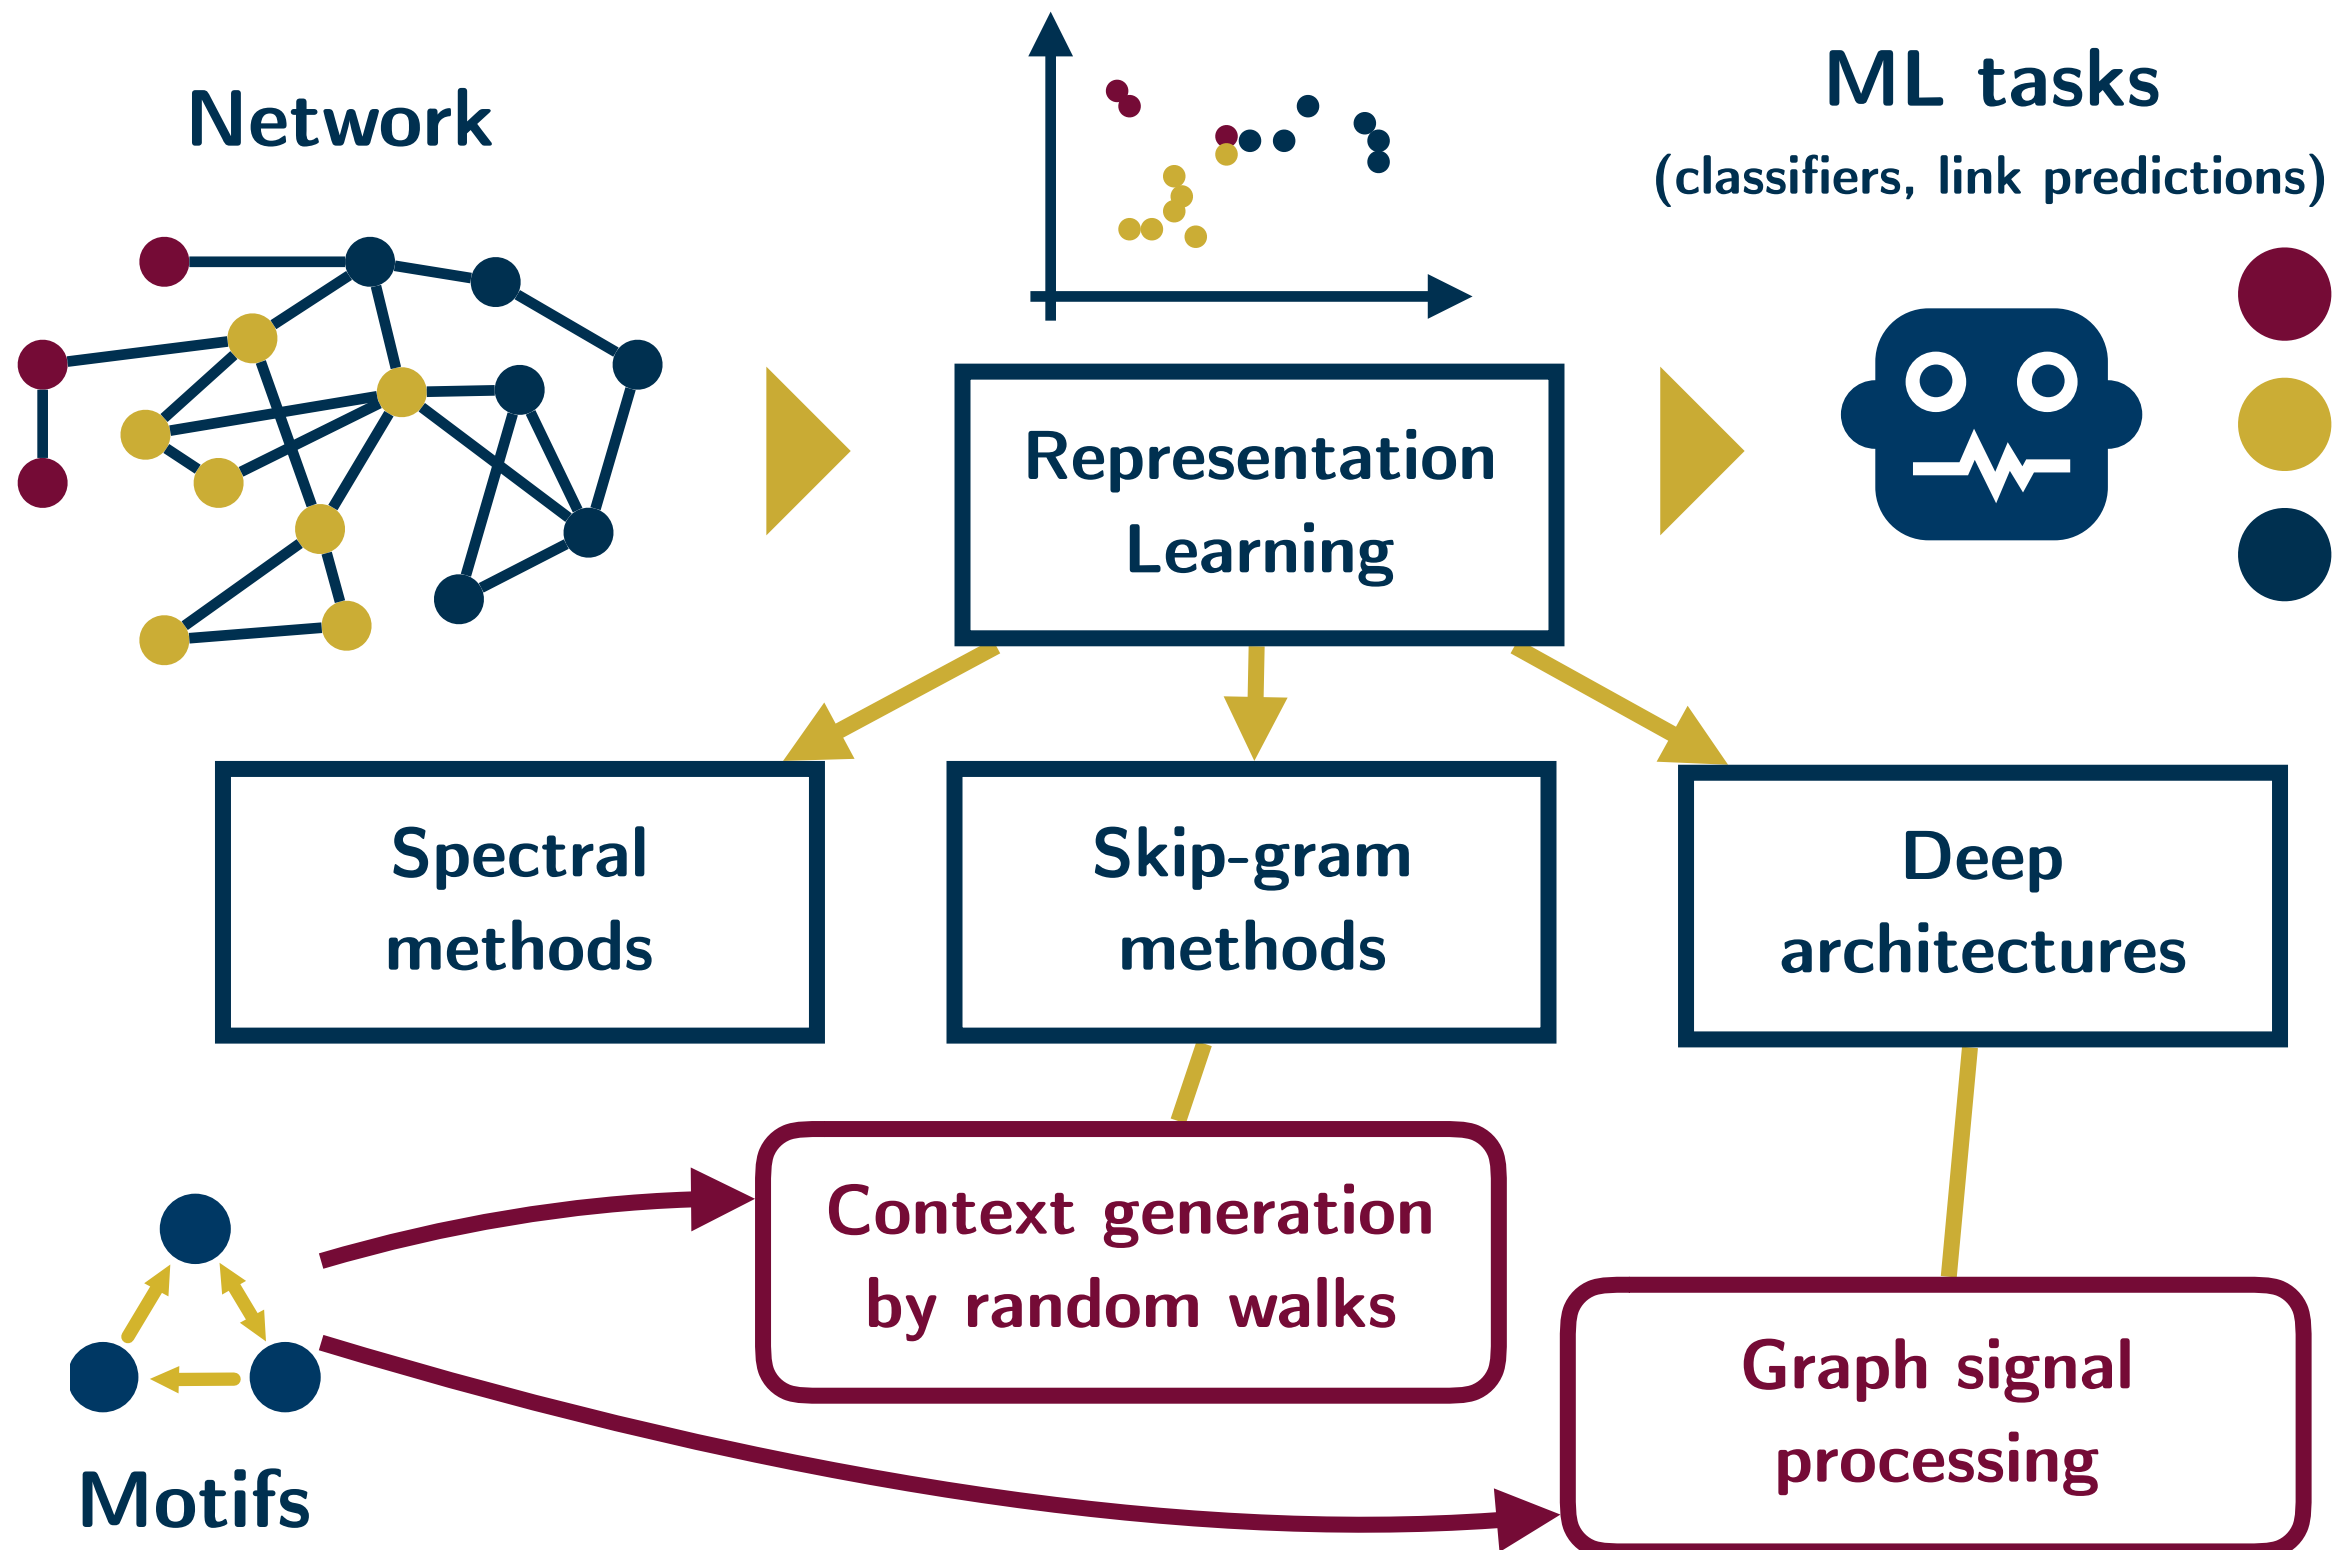

Motif conductance *(Benson, 2016)*

- Generalization of graph conductance.
- Motif-cooccurrence matrix.
- Good results for graph partitioning.

$$\phi_m(S) = \frac{\text{cut}_M(S, \bar{S})}{\min[\text{vol}_M(S), \text{vol}_M(\bar{S})]}$$

Datasets:

- Blogcatalog3
- Cora, Citeseer, Pubmed
- Facebook (EgoNet)
- Transcription networks

<i>Networks</i>	<i>#nodes</i>	<i>#edge</i>
Blogcatalog3	10312	333983
Cora*	2708	5429
Citeseer*	3327	4732

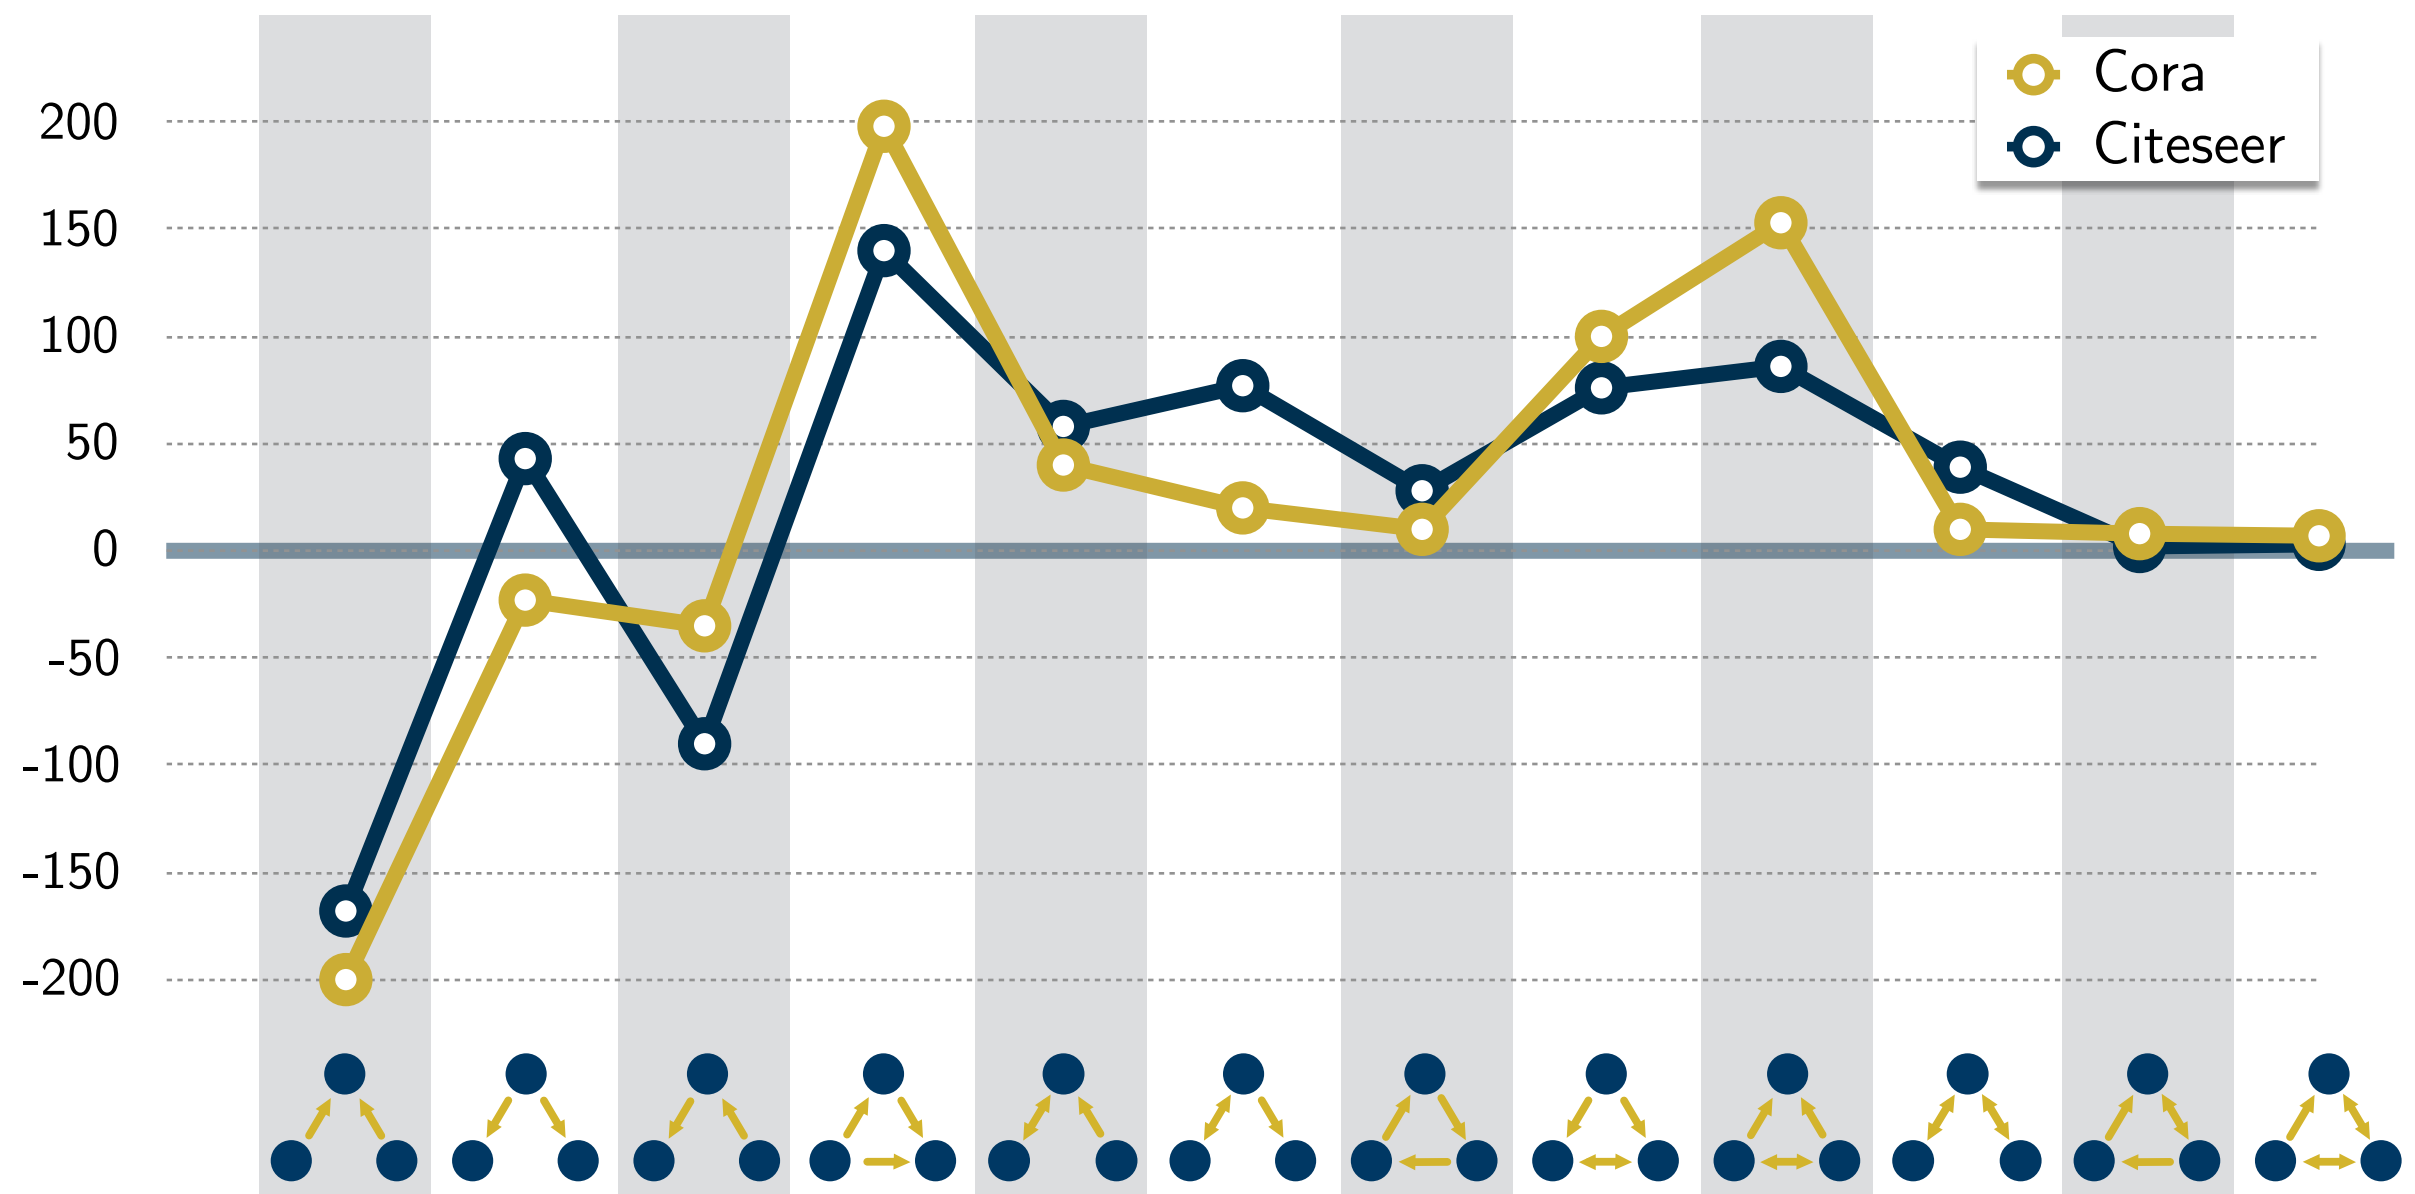

* Each node has a feature vector (tf-idf)

Deciding motif:

- Motif frequency
- Z-score
- Motif conductance

$$z_m = \frac{N_m(emp) - N_m(rnd)}{\sigma_m}$$

Significant graph - Directed size 3 motifs

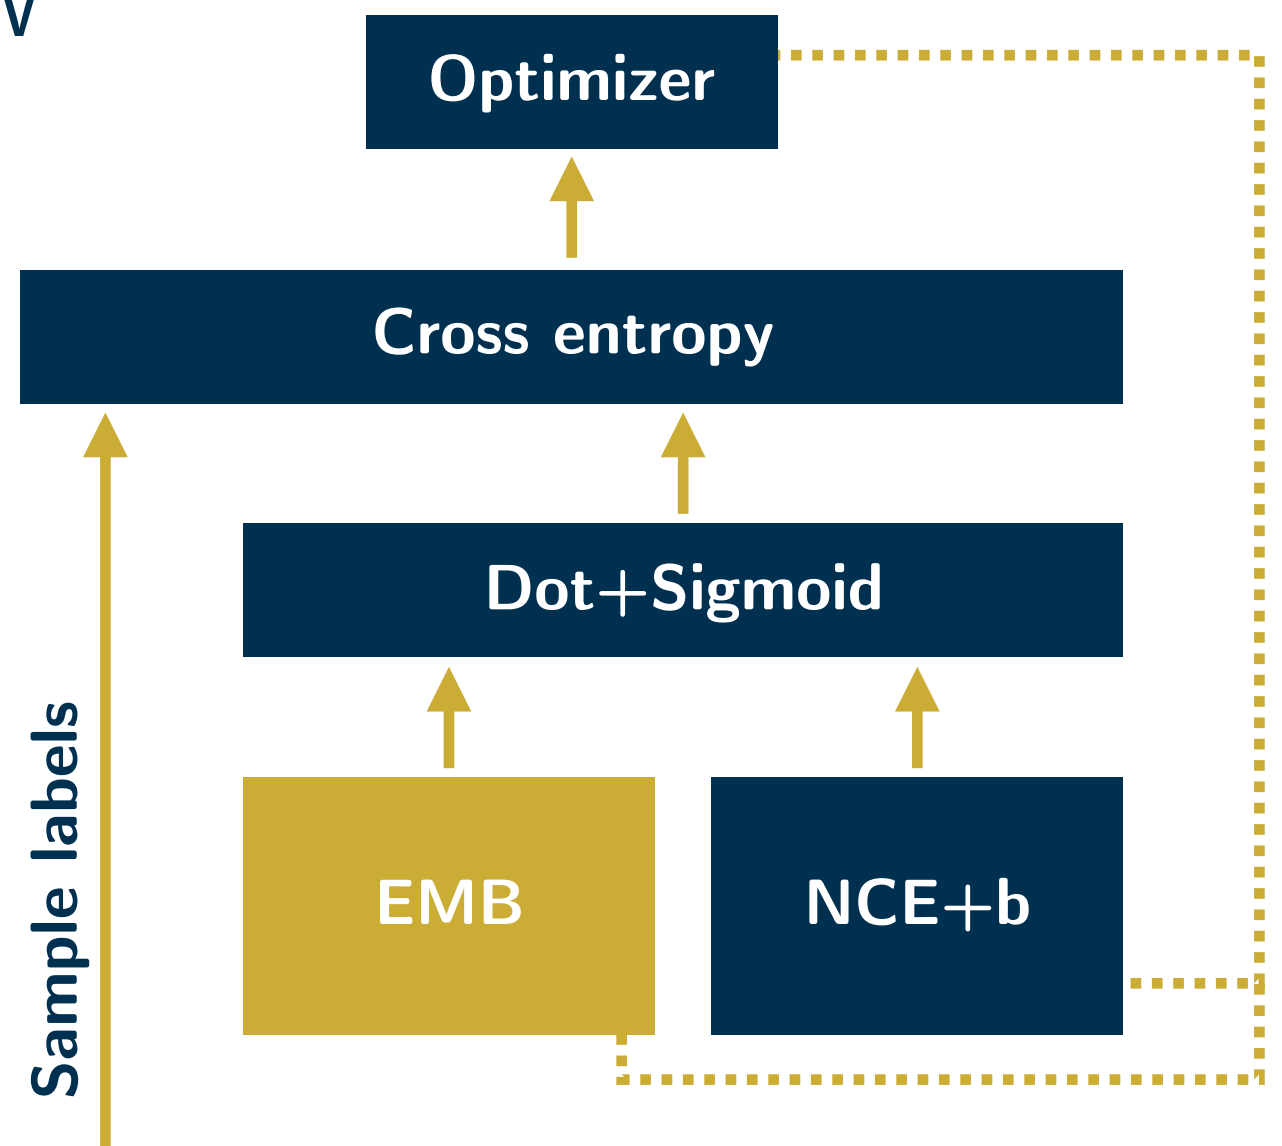

Using motif as a guiding pattern

- DeepWalk := Skip-gram+RW
- LINE := DeepWalk+bi-fan
- node2vec := Skip-gram + bias-ed walk
- motifwalk := Skip-gram + motif walk

Add animation to explain the motif walk vs random walk

Generated context: ● ● ● ● ● ● ● ● ● ● ● ●

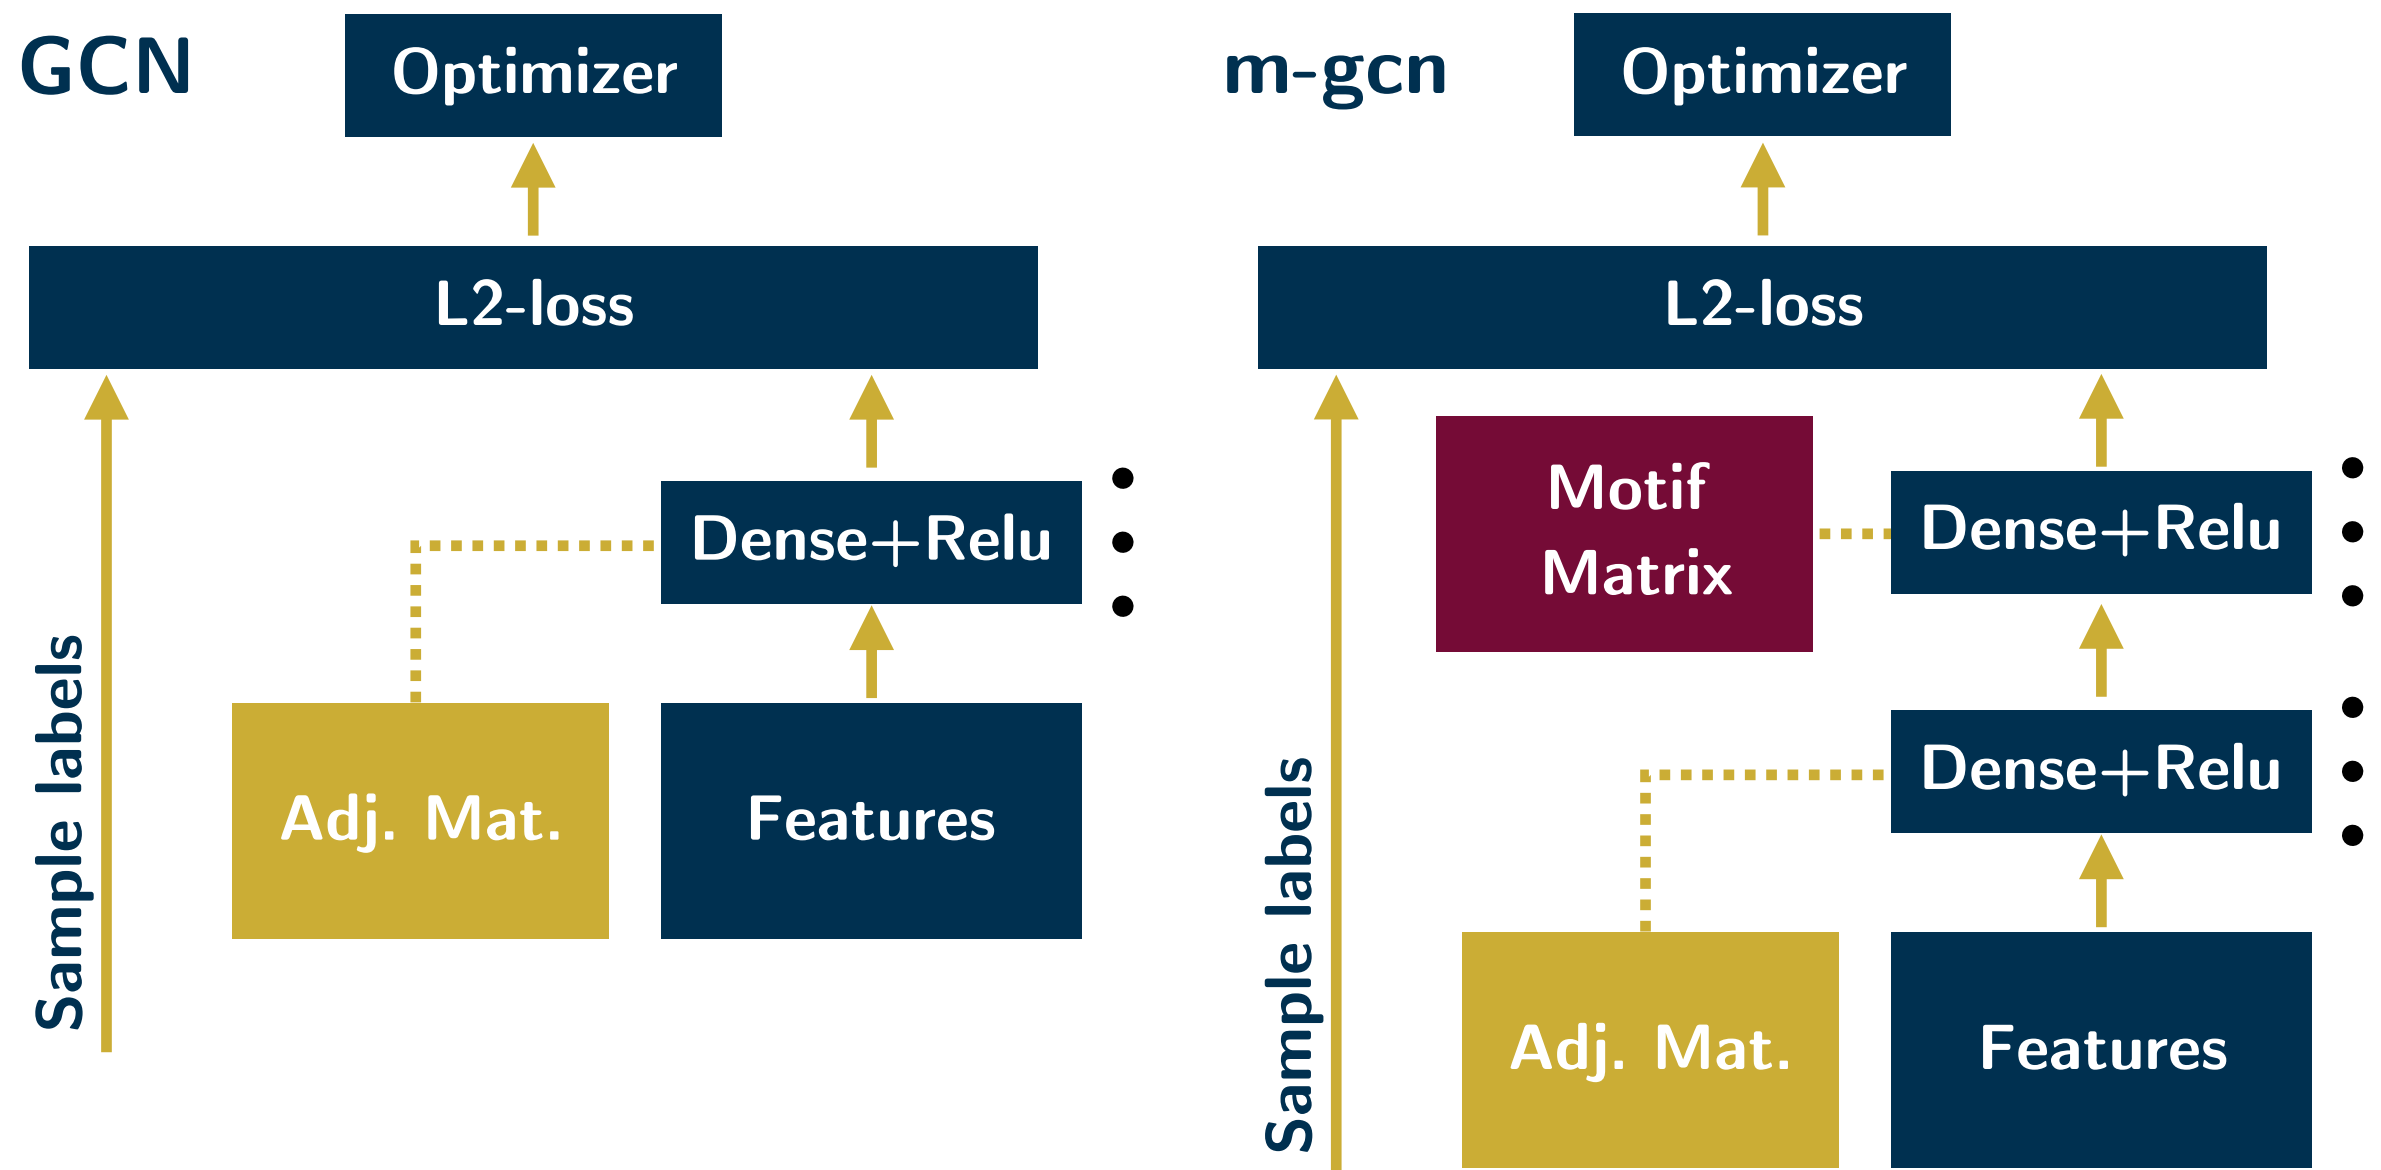

Node multi-label classification

- Blogcatalog3 - f1 score
- 39 classes (imbalanced), nodes can have multiple labels

- Bottleneck at context generation.

Motif laplacian for graph convolutional networks

Node label classification

- Citation networks: Cora, citeseer, pubmed. - f1 and acc.
- 3 to 6 classes, each node has exactly one label.

<i>Methods</i>	Cora		Citeseer		Pubmed	
	accuracy	macro	accuracy	macro	accuracy	macro
Spectral Clus.	59.5	-	42.7	-	65.3	-
DeepWalk	67.2	-	43.2	-	65.3	-
GCN	81.5	-	70.3	-	79.0	-
m-gcn (ours)	83.3	-	71.4	-	80.4	-

- Explaining why does it work.
- Minor contribution.

My interests:

- Network sampling (diversity oriented).
- Turn m-gcn into a generative model.

Agenda:

- Investigate graph spectral theory.
- Determinantal processes on graphs.
- Graph motif sampling model definition.
- (opt.) Generative Adversarial Networks and Auto-Encoders.

Motif here!

Algorithm 1: Motif context sampling $P_m(\omega)$.

Data: Undirected Graph $G = (V, E)$;

Input: start vertex, walk length, motif $M = (V', E')$,
bias β ;

Result: Vertices in the local motif structure;

vertexList \leftarrow [start vertex]

current \leftarrow start vertex

initialize dequeue buffer Q of size $|V'|$

while vertexList.length < walk length **do**

 candidate \leftarrow random(neighbor(current))

 Q.append(candidate)

if Isomorphic(Q, M) **then**

if random < β **then**

 vertexList.append(candidate)

else

 continue

else

if random > β **then**

 vertexList.append(candidate)

else

 continue

return vertexList

NPL Skipgram
